Human DNA is composed of approximately 3 billion nucleotide base pairs, organized into 23 pairs of chromosomes within each cell nucleus.

Structure of DNA: Double helix composed of four nucleotides?adenine (A), thymine (T), cytosine (C), and guanine (G). The specific sequence of these bases encodes genetic information.

Genomic Organization: Genes are segments of DNA that encode proteins. The human genome contains roughly 20,000?25,000 protein-coding genes, interspersed with non-coding regions that regulate gene activity.

Chromosomes and Genes

Chromosomes: Structures composed of DNA and proteins (histones) that package genetic material efficiently. Humans have 46 chromosomes, arranged in 23 pairs?one from each parent.

Genes: Functional units of heredity. Variations in genes, known as alleles, contribute to individual differences in traits and disease susceptibility.
